

Stories for the people who keep the physical world moving.

Long-form writing, social concepts, and customer storytelling created for Squint's Content Marketing Lead application.

01 Narrative writing

02 Social series

03 Customer stories

THE THROUGHLINE

Technology earns attention when people can see themselves in the story.

My approach starts with the audience: what they do, what slows them down, and what they need to trust. From there, I find the most concrete human tension, connect it to product value, and shape the story for the channel - without sanding away the specificity that makes it memorable.

Haylie Wong

Senior copywriter, product designer, and AI-assisted builder

The most valuable machine in a factory might be the person standing beside it.

A narrative article concept for Squint about the knowledge hidden in everyday industrial work.

A line stops. Not dramatically - no sparks, no cinematic alarm - just a small change in sound that an experienced operator notices before anyone else. They tilt their head, listen again, and walk toward the machine. A few minutes later, production is moving.

Ask what happened and the answer may sound almost too simple: *I've heard that noise before.*

That sentence contains years of pattern recognition. It holds the memory of previous failures, the feel of a healthy machine, the sequence of checks worth trying, and the judgment to know which warning can wait. None of it necessarily lives in a manual. Much of it lives in a person.

Manufacturers often call this tribal knowledge. The phrase can make it sound informal or secondary, but on a factory floor it is operational infrastructure. It keeps lines moving, helps new operators avoid old mistakes, and turns written procedures into competent action. The problem is not that this knowledge is informal. The problem is that it is difficult to capture, difficult to find, and dangerously easy to lose.

When expertise walks out the door

An experienced worker does not leave behind only an empty role. They may take thousands of small decisions with them: which vibration matters, which workaround is safe, which step people consistently misread, and which question a new operator will be afraid to ask. Traditional documentation records the standard path. Experienced people often know what to do when reality refuses to follow it.

The usual response is to document more. But a larger binder is not the same as accessible knowledge. Information can be technically available and still fail the person who needs it - buried in a shared drive, separated from the equipment, written without the context of the actual task, or frozen while the work keeps changing.

The opportunity is not simply to store more information. It is to make operating knowledge usable at the moment of work.

From documentation to intelligence

Imagine if the operator hearing that unfamiliar noise could ask a question in plain language and receive guidance grounded in the organization's approved procedures, equipment context, and accumulated know-how. Imagine if the answer arrived where the work was happening, not after a search through disconnected systems.

This is where industrial AI becomes meaningful. Its value is not that it sounds intelligent. Its value is that it can connect fragmented context and help a person take the next right action. The best system does not attempt to replace the operator's judgment; it makes more of the organization's knowledge available to that judgment.

That distinction matters. Factory work is physical, contextual, and unforgiving of confident nonsense. Useful AI must be grounded in the standards, equipment, and reality of a specific organization. It should make expertise easier to access while keeping people in control of the work.

Every operator an expert

The phrase sounds ambitious because it is. Expertise still takes experience. But experience compounds faster when people can reach the right knowledge at the right moment - when a first-week operator can follow guidance shaped by a veteran, when a technician can surface the procedure that matches the machine in front of them, and when a manager can improve a workflow based on what actually happens on the floor.

The knowledge gap in manufacturing is often described as a retirement problem. It is also a design problem. Critical knowledge exists, but the systems around it have not made that knowledge easy enough to capture, connect, and use.

The next industrial revolution will not be powered by AI alone. It will be powered by the moment AI helps human expertise travel farther.

WHY THIS PIECE

I chose a human opening rather than a product opening. The article makes an abstract category - industrial intelligence - concrete through a recognizable moment, then moves from customer tension to Squint's product philosophy without reading like a feature list.

Disclosure: Speculative work created independently for this application. Product framing is based on Squint's publicly available website and job description; it was not commissioned or approved by Squint.

One idea. Three ways into the feed.

A LinkedIn series designed to make industrial knowledge vivid, useful, and shareable.

01 THE SOUND

The machine did not send an alert.

It changed its sound.

The operator beside it noticed. She had heard that variation once before - three years ago, before a failure that stopped the line.

That is the challenge with tribal knowledge: it can prevent downtime, train the next generation, and protect quality. But too often, it lives in one person's memory.

Industrial AI becomes useful when it helps that expertise travel - to the next operator, the next shift, and the next site.

02 THE BINDER

A 300-page procedure manual can contain the answer and still fail the person asking the question.

Because 'available' is not the same as accessible.

On the floor, the right information has to arrive:

- in the context of the actual equipment
- in language the operator can use
- at the moment a decision is being made

The future of industrial knowledge is not a bigger binder. It is context that can act.

03 THE HANDOFF

What does an expert leave behind when they retire?

Not just a job description.

They leave the workaround that saved a shift. The warning sound no manual describes. The question every new hire asks. The judgment that turns a procedure into a result.

Capturing that knowledge is not an archive project. It is how one generation of operators makes the next one stronger.

Build the story from the floor up.

A repeatable interview-to-campaign system for turning customer outcomes into specific, credible narratives.

1	Find the scene. Start with a specific shift, machine, worker, or failure - not a generic transformation claim.
2	Follow the friction. Document the old workflow, where knowledge broke down, and what the consequences felt like for operators and managers.
3	Earn the outcome. Connect measurable impact to the human behavior and product capability that produced it. Make every claim traceable.
4	Design the series. Turn one interview into a flagship case study, executive post, operator quote card, short video, sales proof point, and follow-up lesson.

SAMPLE INTERVIEW PROMPTS

- Take me to the moment you knew the old process was no longer working.
- What did an experienced operator know that was difficult to teach or document?
- What changed first after implementation: behavior, confidence, speed, or results?
- Which outcome would sound impressive but miss the real reason this mattered?
- What would another plant leader need to see before trusting this approach?

WHY THIS SYSTEM

The job is not simply to publish more. It is to create a dependable supply of differentiated stories. This system makes customer empathy operational: it protects specificity during interviews, connects human moments to business value, and creates multiple channel-ready assets from one strong source.

Writing instinct, product rigor, and a builder's bias.

These speculative pieces are grounded in the way I already work across content and products.

SENIOR COPYWRITING

At The Immigration People, I translate complex, high-stakes information into clear guidance while adapting voice and detail to the audience.

CUSTOMER UNDERSTANDING

At abillion, I led moderated usability research across eight tasks, synthesized customer friction, and carried the findings into a launched product experience.

VISUAL RANGE

My design background spans responsive websites, mobile products, information architecture, design systems, game UX, and art direction in Figma and production environments.

STARTUP AUTONOMY

As a studio co-founder and independent creator, I originate concepts, make strategic and creative decisions, collaborate with development, and iterate directly from audience feedback.

AI-NATIVE EXECUTION

I use AI for research synthesis, concept development, rapid prototyping, coding support, and iteration - then apply human judgment, testing, and craft to the output.

LET'S MAKE INDUSTRIAL INTELLIGENCE IMPOSSIBLE TO IGNORE.
